Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Arch. Biochem. Biophys. 316:917-925(1995).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CATALYTIC ACTIVITY: Hydrolysis of proteins and small molecule substrates, with a preference for Arg in Pl.

ENZYME REGULATION: Requires cysteine for activation and Ca(2+) and/or MG(2+) for stabilization. It is stimulated by glycine-containing dipeptides. It is resistant to inhibition by proteinase inhibitors in human plasma.
                                                                                                                                                                                                                                                                                                                                                                                                                              NUCLEOTIDE SEQUENCE [GENOMIC DNA], AND PROTEIN SEQUENCE OF 228-290 AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (gingipain) from Porphyromonas gingivalis.";
J. Biol. Chem. 267:18895-18901(1992).
-!- FUNCTION: Thiol protease which is believed to participate in intracellular degradation and turnover of proteins. Its proteolytic activity is a major factor in both periodontal tissue destruction and in bacterial host defense mechanisms. Activates complement C3 and C5.
                                                                                                                                   Gaps

New method for the specific detection of Salmonella enteritidis infections of poultry comprises contacting a biological sample with antigenic fragments of S. enteritidis fimbrial and/or flagellin proteins.

Claim 18; Page 42; 49pp; English

The present sequence represents the C128 fragment of the fimbrial Sef14 antigan of Salmonella entertiidis. The specification describes a method for detecting S. enteritidis in a biological sample obtained from poultry. The method comprises contacting the sample with an antigenic fragment of S. enteritidis fimbrial or flagellin protein and detecting the formation of a complex, where the fragment is specifically recognized by S. enteritidis antibodies. The antigenic fragments are specific to Salmonella enteritidis and enable specific detection of S. enteritidis even in the presence of other Salmonella spp. The methods are useful for the specific detection of S. enteritidis derived from poultry

The present sequence represents sefA found in the sef gene cluster from Salmonella enteritidis. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 DGQGQPVFRGRIQGANINDQANTGIDGLAGWRVASSQFTLAVPVTTFGKSTLPAGTFTAT 120

                                                                         ö
                                                                                                                                                                                            120
                                                                                                                                                                                                              This sequence is a fragment of the Salmonella enteritidis (Se) Sef14 protein, encoded by the sefA gene. The method of the invention is for detecting antibodies (Ab) against Se in an animal by treating a sample with a truncated Sef14 antigen (Ag), lacking at least the native Sef14 signal peptide, and detecting any Ab-Ag complex formed. Detection (by enzyme-linked immunosorbent assay or agglutination tests) of the Ab is used to diagnose Se infection in birds, especially chickens and turkeys. The Ag can also be used in vaccines to protect poultry against Se infection. Detection of the Ab is a sensitive, specific method for reliable and routine screening of animals. The Ag are easily produced in large quantities, in pure form, without requiring special growing conditions, so are suitable for large scale screening of flocks

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents the fimbrial Sef14 antigen of Salmonella enteritidis. The specification describes a method for detecting S. enteritidis in a biological sample obtained from poultry. The method comprises contacting the sample with an antigenic fragment of S. enteritidis fimbrial or flagellin protein and detecting the formation of a complex, where the fragment is specifically recognized by S. enteritidis antibodies. The antigenic fragments are specific to Salmonella enteritidis and enable specific detection of S. enteritidis even in the presence of other Salmonella spp. The methods are useful for the specific detection of S. enteritidis infections in biological samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 DGGGOPVFRGRIQGANINDQANTGIDGLAGWRVASSQETLNVPVTTFGKSTLPAGTFTAT 120

```

```
The sequence given is Salmonella enteritidis fimbrial antigen (SBPA). Salmonella organsisms have fimbria-like structures on their surfaces and it has been suggested that there are antigenically distinct types of fimbria, ie. possesing specific epitopes on the fimbrial antigens. This sequence has an amino acid sequence which forms an epitope on the fimbria enteritidis, and some strains of the species S. which is apparently absent in virtually all other serotypes. This antigen can be used for testing for the presence of Salmonella microorganisms in clinical samples such as animal remains or prods. Food samples and infected environmental samples.                                                                                                                                                                                                                                                                                                                                          This sequence is a fragment of the Salmonella enteritidis (Se) Sef14 protein, encoded by the sefA gene. The method of the invention is for detecting antibodies (Ab) against Se in an animal by treating a sample with a truncated Sef14 antigen (Ag), lacking at least the native Sef14 signal peptide, and detecting any Ab-Ag complex formed. Detection (by enzyme-linked immunosorbent assay or agglutination teste) of the Ab is used to diagnose Se infection in birds, especially chickens and turkeys. The Ag can also be used in vaccines to protect poultry against Se infection. Detection of the Ab is a sensitive, specific method for reliable and routine screening of animals. The Ag are easily produced in large quantities, in pure form, without requiring special growing conditions, so are suitable for large scale screening of flocks
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 AAQNTTSANWSQDPGFTGPAVAAGQKVGTLSITATGPHNSVSIAGKGASVSGGVATVPFV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               16-JUN-3
                                                                                                                                                                                                                                                                                                                              This invention relates to a novel plant transcription factor by Dypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are useful for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions when compared to wild-type reference plants. The present sequence is that of plant transcription factor protein which was used during the development of the transgenic plants of the invention.
                                                                                                                                                                                                                                                   New transgenic plants for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 AAQNĮTSANWSQDPGFTGPAVAAGQKVG-TLSITATGPHNSVSIAGKGA-SVSGGVAŢVP 58
